RIVETARA

Master Product & App Store Specification

Version 1.4 - 19 September 2026

Build principle: Tell Rivetara once. Let the AI handle the admin.

This document is the development source of truth for the Rivetara MVP and its path to iPhone distribution. It covers product intent, frontend, backend, AI actions, offline-first operation, sync, data, payments, privacy, security, testing and App Store readiness.

v1.2 compliance update: current Apple submission, billing, login, recording, third-party AI, privacy-manifest, age-rating, encryption and review requirements are now explicit and mandatory.

1. Product Vision

Rivetara is an AI office manager / AI business employee for tradespeople. It should not feel like a traditional job-management system with an AI chat box added on. The AI is the primary interface and should actively prevent important business tasks from being forgotten.

Core promise: a tradesperson can speak, take a photo or send information to Rivetara; Rivetara understands the business context, performs the appropriate administrative action, stores the result and confirms what it did.

- Primary customers: small trade businesses such as electricians, plumbers, locksmiths, garages and similar operators.
- Target commercial model: approximately GBP 20/month, with a short free trial where commercially appropriate.
- The experience must be premium, simple and fast. Manual forms are fallback tools, not the centre of the product.
- Rivetara should develop useful business memory: customers, jobs, quotes, invoices, prices, materials, suppliers and prior activity.

2. Core User Experience

The main screen should be deliberately uncluttered. A prominent Rivetara AI control is the primary action. The interaction is press once to start listening and press again to stop; it must not require press-and-hold. When an action succeeds, Rivetara should give a short natural voice acknowledgement rather than forcing the user through a long text conversation.

The dashboard should surface what needs attention rather than requiring the user to hunt through menus.

- Overdue invoices and value outstanding.
- Completed jobs that have not yet been invoiced.
- Quotes requiring follow-up and their potential value.
- Today's jobs and expected revenue.
- Expenses waiting to be processed or exported to an accounting integration.
- A clear CTA such as 'Would you like me to deal with these?'
- Dashboard summary cards are tappable and open the relevant underlying records.

3. Frontend Specification

- Apple-quality visual language: clean spacing, restrained animation, modern typography and clear hierarchy; do not copy protected Apple product interfaces or branding.
- Authentication / sign-up flow, followed by profile setup. Trade is stored in the profile and is not repeatedly requested on the login screen.
- Primary navigation remains small and understandable: Home/AI, Work, Money, Activity and Profile/Settings may be grouped further during usability testing.
- AI control clearly shows idle, listening, processing, offline/queued, syncing, success, needs-review and error states.
- Photos can be captured or selected and attached to jobs, expenses or other records.
- Users can inspect, correct and manually enter records where needed, even though AI is the default workflow.
- New accounts start with genuine zero-state counts; production must never display fake jobs, invoices or quotes.
- Accessibility: support VoiceOver, Larger Text / Dynamic Type, sufficient contrast, large touch targets, Reduce Motion where applicable and no critical meaning communicated only by colour.

4. AI Action Engine

Rivetara must distinguish between conversation and an instruction that changes business data. Actions must execute through typed, validated backend tools. A language model must never write directly to production records.

- Supported examples: create/update customer, create job, mark job complete, create quote, create invoice draft, record expense, create diary entry, schedule follow-up, chase an overdue invoice and answer questions about historic business records.
- Ask for concise confirmation before high-impact or ambiguous actions such as sending an invoice, deleting data, changing a large monetary amount or messaging a customer.
- Every AI mutation creates an audit event with user, timestamp, source input, interpreted intent, action, affected record IDs and result.
- Retrieve only the business context required for the task and enforce tenant/user permissions.
- Do not fabricate customer, price, tax or job information. Ask for missing information or create a clearly marked draft.
- AI output and automation status must be truthful. Queued, drafted, failed and completed are distinct states in the user interface and audit trail.

Third-party AI consent - mandatory

Before Rivetara sends personal data to a third-party AI provider, the app must clearly explain what data will be sent, why it is needed, who receives it and obtain the user's explicit permission. Consent must be recorded and revocable where applicable.

- Map every AI data flow, including voice, photos, customer details, job addresses, invoice content and telemetry.
- Minimize and redact data before transmission where feasible. Provider contracts and settings must prohibit unnecessary training or retention.

5. Offline-First Mode - Mandatory

Rivetara must remain useful on jobsites with poor or zero connectivity. Offline input is captured locally first. AI processing that requires the cloud is queued and begins automatically after a reliable connection returns.

Offline capture workflow

- The user can create a voice capture, typed note, photo, job note, expense capture or other supported input without a network connection.
- Store each item in an encrypted on-device database/file store with a unique client-generated ID, creation time, business/user ID and sync state.
- Where supported, store voice input as audio when cloud transcription is unavailable. Never pretend an offline AI action completed when it was only captured.
- Immediately show 'Saved on this device - waiting to sync' or equivalent and allow the user to continue working.

Reconnect and sync workflow

- Use a background-capable sync queue subject to iOS execution limits. Always retry when the app returns to the foreground.
- Upload queued media/input securely, acknowledge durable server receipt, then hand the item to the AI/action pipeline.
- The server returns resulting record IDs and status; the device reconciles local state and marks the item complete.
- Items requiring clarification or approval become 'Needs you' rather than retrying indefinitely.

Reliability rules

- Use idempotency keys/client IDs so a retry cannot create duplicate invoices, jobs, expenses or messages.

- Use explicit states: local_pending, uploading, received, processing, needs_review, complete and failed_retryable.
- Use resumable/retry-safe media upload where practical and preserve local sources until durable receipt is confirmed.
- Use exponential backoff and expose manual retry. Resolve conflicts deterministically using version checks and never silently overwrite a newer edit.
- Queued communications or money-related actions must not be sent twice after reconnection.
- Protect offline data using iOS data protection and encrypted local storage. Secrets and tokens belong in Keychain.

6. Backend & Data Architecture

- Multi-tenant backend with strict separation by business/account.
- Core entities: User, Business, Customer, Job, Quote, Invoice, InvoiceLine, Expense, Supplier, Material/Price, Appointment, FollowUp, Attachment, AIInteraction, Action/AuditEvent and SyncItem.
- API authentication, authorization and tenant checks are enforced server-side for every protected operation.
- Use a relational database for business records and object storage for photos/audio/documents; store references and metadata in the database.
- Background workers handle AI processing, document generation, scheduled follow-ups, integration sync and retry queues.
- Webhook processing verifies signatures, is idempotent and records delivery/processing status.
- Observability includes structured logs, error monitoring, queue health and auditable action history without logging unnecessary sensitive content.

7. Invoices, Quotes & Documents

- Generate branded invoice and quote PDFs from structured data. Verified profile/settings fields supply business name, logo, details and legally required invoice information.
- Store documents and records in chronological history with year/date filters; retrieve old records through UI and natural-language queries.
- AI may suggest line items from job context, but monetary and tax details remain inspectable before external sending where confidence or policy requires it.
- Document numbering is collision-safe and backend-controlled, especially when several offline devices later sync.

8. Integrations

- Accounting architecture supports services such as Xero through OAuth, scoped permissions, secure token refresh and explicit connection/disconnection.
- WhatsApp may be an alternate capture channel only through an approved business messaging integration. Voice notes and photos enter the same normalized ingestion pipeline.
- Social posting/photo-to-caption remains secondary, not Rivetara's primary identity.
- Integration failures must not corrupt canonical business records; expose status and retry safely.
- The app must let users revoke social/integration access where required. Third-party terms and permissions must expressly allow the implemented use.

9. Subscription, Billing & Entitlements

Billing is separated from product entitlements. The backend owns normalized entitlement states such as trialing, active, grace_period, past_due, cancelled and expired regardless of subscription origin.

Default iPhone commercial decision: use Apple In-App Purchase for the consumer Rivetara subscription that unlocks digital app functionality. Any alternative must be approved against the exact storefront rules immediately before implementation and submission.

- Use StoreKit and Apple's supported transaction APIs; validate/reconcile transactions server-side and consume App Store Server Notifications.
- Provide Restore Purchases and a Manage Subscription route. Entitlement follows the authenticated Rivetara account, not one device.
- Before purchase, clearly disclose price, renewal interval, auto-renewal, trial length, what is included, what changes when the trial ends and how to cancel.
- Prevent accidental duplicate subscription variants and implement predictable upgrade, downgrade, grace-period, billing-retry, refund and expiry handling.
- A free stand-alone companion to a paid web service may avoid IAP only when it contains no in-app purchasing and no disallowed call to action to purchase elsewhere. Do not assume United States link rules apply to the United Kingdom or other storefronts.
- App metadata and screenshots must make paid/subscription features clear. Include required privacy-policy and terms/EULA links.

10. Privacy, Security & User Control

- Publish accurate privacy policy and terms before public launch, covering collection, use, processing, retention, deletion, third parties, AI providers and user rights.
- Request microphone, camera/photo-library and notification access only when the related feature is used, with accurate purpose strings and usable alternatives where feasible.
- Minimize collection; encrypt data in transit and protect it at rest; secure, rotate and revoke credentials where supported.
- Provide an easy-to-find in-app account deletion route that deletes the account and associated data, subject only to disclosed lawful retention. Temporary deactivation alone is insufficient.
- Provide data export, correction, support and consent-revocation paths appropriate to the product and applicable privacy law.
- Do not use customer business data to train models unless explicitly intended, lawful, transparently disclosed and appropriately controlled. Default to no unnecessary model retention.
- Maintain backups, recovery procedures, rate limits, abuse protection and a documented incident response process.

Recording and capture indication - mandatory

- Obtain explicit user consent and show a clear visual and/or audible indication whenever the microphone, camera, screen or other user activity is being recorded or logged.
- The press-on / press-off AI control must make listening and stopped states unmistakable and accessible through VoiceOver.

Account login - mandatory

- If Rivetara uses only its own email/password, passkey or account system, a third-party equivalent login is not required by Apple's Login Services rule.
- If Google, Facebook or another third-party/social login creates or authenticates the primary account, provide an equivalent privacy-preserving login option meeting Apple's requirements; Sign in with Apple is the standard implementation.

11. Apple App Store Compliance - Mandatory Gate

No iPhone build may be submitted until every applicable item in this section is evidenced as complete. Compliance must be checked against the shipped build, not assumed from this specification.

Requirement	Mandatory implementation / evidence
Build toolchain	Use at least Xcode 26 and the iOS 26 SDK under the requirement effective 28 April 2026. Re-check Apple's current minimum on submission day and use the later requirement if it has changed.
Complete review build	No dead controls, placeholder screens, broken authentication, hidden features or inaccessible core services. Backend and review integrations remain active during review.
Review access	Provide a working demo account or full demo mode, populated safe test data and precise review notes for AI, offline capture, sync, subscription and integrations.
Privacy disclosures	App Privacy answers match actual first-party and third-party SDK data flows, including audio, photos, customer/job content, identifiers, diagnostics and linked/tracking status.
Privacy manifests	Include a valid PrivacyInfo.xcprivacy. Declare collected data and approved reasons for required-reason APIs used by app code or SDKs. Use compliant SDK versions and required signatures/manifests.
Age rating	Complete the current App Store Connect age-rating questionnaire, including the updated questions required from 31 January 2026. Reassess if AI or user-visible content changes.
Encryption/export	Answer App Store Connect export-compliance questions accurately. Add the appropriate Info.plist declaration and upload documentation if required.
EU distribution	If available in EU storefronts, declare and verify Digital Services Act trader status and display the required trader contact details.
Metadata	Production icon, current device screenshots, accurate description, subtitle/keywords, support URL, privacy-policy URL, copyright, category, age rating, review contact and version notes.
Accessibility labels	Only claim App Store accessibility features that have been tested against Apple's evaluation criteria. Test VoiceOver, Larger Text, contrast, colour independence and reduced motion.

Permissions and user choice

- Purpose strings must state the precise user-facing reason. Do not request unrelated access or require optional permissions as a condition of unrelated features.
- If access is declined, keep the app useful where feasible: typed input for microphone refusal, camera capture versus photo picker choices and manual reminders when notifications are off.

Submission and final audit

- Use TestFlight for beta testing. Test clean install, upgrade, login, account recovery/deletion, purchase/restore, entitlement changes, permissions, AI consent, offline restart, reconnection, duplicate prevention, push notifications and failure recovery.
- Run an archive/privacy report and dependency inventory before every submission. Compare App Privacy answers and the privacy policy to the final build.
- Re-check the live App Review Guidelines, Upcoming Requirements and storefront-specific commerce rules immediately before implementing iOS billing and again within 48 hours before submission.

12. Quality & Acceptance Tests

Area	Minimum acceptance
Voice AI	Press-start / press-stop works; listening is visibly indicated; correct action or concise clarification; spoken confirmation.
Offline	Capture in airplane mode survives app restart, syncs exactly once and creates no duplicate server record.
Invoices	Correct business/customer/job data, collision-safe numbering and explicit draft/send states.
Sync	Retry, conflict, needs-review and failure states are visible and recoverable.
Security	Tenant isolation, authorization, secure local storage, Keychain use and secrets handling verified.
Billing	Trial/active/grace/expired/refunded state consistent across backend, StoreKit and devices; restore works.
Privacy	AI consent, purpose strings, data deletion/export and App Privacy declarations match real flows.
Accessibility	VoiceOver task flow, Larger Text, contrast, colour independence, Reduce Motion and touch targets tested.
App Store	Toolchain, manifests, required-reason APIs, SDK inventory, age rating, export compliance, review account and metadata complete.

13. Recommended Build Sequence

- Lock core data model, authentication, tenant security, consent model and audit model.
- Build the AI action/tool layer with a small set of dependable, reversible actions.
- Build the simplified mobile/web UX around the single Rivetara AI workflow.
- Implement local offline store, queue, idempotency and reconnect sync before field testing.
- Add invoice/quote generation and business history retrieval.
- Implement StoreKit billing and the normalized entitlement service; test all iOS/web account states.
- Add priority integrations behind stable interfaces with revocation and failure recovery.
- Run a small tradesperson beta; measure completion, corrections, failures and time saved.
- Complete privacy manifests, SDK/API audit, metadata and the mandatory Apple compliance gate.
- Test through TestFlight, close review gaps and submit. Expand automation only after core actions are demonstrably reliable.

14. Definition of the MVP

The MVP succeeds when a real tradesperson can open Rivetara, describe work by voice or photo, have the correct business record created or prepared, retrieve it later and keep capturing work offline without loss or duplication. The product must reduce admin rather than create another system to maintain.

Developer instruction: Treat this document as the master product specification for v1.2. When implementation choices conflict with the principles above, prefer reliability, user control, privacy, offline resilience and simplicity. Apple compliance is a release gate, and current rules must be checked again before billing implementation and submission.

15. Authoritative Apple References

Compliance baseline checked 17 September 2026. These links are authoritative starting points; the live versions control if Apple changes a requirement.

- Export compliance overview - https://developer.apple.com/help/app-store-connect/manage-app-information/overview-of-export-compliance/

16. Apple Watch Companion Experience

Product principle: Rivetara on Apple Watch is a fast voice doorway into the same AI office manager. It is not a miniature job-management system.

Core interaction

- Launch from the Rivetara watchOS app, a watch-face complication or an approved WidgetKit/App Intent surface.
- The first screen contains one large Rivetara AI control. Tap once to start listening and tap again to stop. Do not require press-and-hold.
- Show unmistakable idle, listening, saved offline, sending, processing, needs-review, complete and failed states. Use accessible text as well as colour or animation.
- Use a clear recording indication, haptic feedback when listening starts and stops, and a short spoken or haptic confirmation after the final result.
- Keep text concise and touch targets suitable for a small display. Business forms, detailed corrections and complex review open on the paired iPhone.

Processing and device handoff

- Record the voice request on Apple Watch using the minimum microphone permission needed for the feature.
- When the paired iPhone is reachable, transfer the capture and metadata through Apple-supported Watch Connectivity. The iPhone or Rivetara backend then runs the normal AI intent, validation and action pipeline.
- The resulting job, diary entry, reminder, quote, invoice draft, expense or other supported record updates the same authenticated Rivetara account across Watch, iPhone and web.
- Return a short truthful result to the Watch, for example: "Done. Dave is booked tomorrow at nine." Never say an action completed when it is queued, drafted or awaiting review.
- Use client-generated capture IDs and idempotency keys across Watch, iPhone and backend so reconnection cannot create duplicate records or communications.

Offline and unavailable-phone behaviour

- If the iPhone or network is unavailable, securely store the capture on the Watch and show "Saved offline - waiting to sync".
- Automatically retry when connectivity returns, subject to watchOS background-execution limits. Preserve the local recording until durable receipt is acknowledged.
- Queued captures follow the existing Rivetara state model: local_pending, uploading, received, processing, needs_review, complete or failed_retryable.
- A future cellular/direct-to-backend path may be added only when authentication, energy use, retry safety and data protection are proven. Phone relay is the initial required architecture.

Security, privacy and account rules

- The Watch companion uses the same Rivetara identity and entitlement as the paired iPhone account. It must not create a separate subscription or isolated data store.
- Do not place API secrets on the Watch. Use short-lived authenticated requests and platform-protected storage for any local credentials or queued audio.
- Microphone permission text, privacy disclosures and App Privacy answers must cover watchOS. Audio retention follows the iPhone minimisation and deletion rules.
- Sensitive customer or financial detail must not be exposed in a complication or notification when the Watch is locked. Respect Apple Watch notification privacy settings.

Minimum Apple Watch acceptance tests

Voice	Tap-start / tap-stop records once; state and haptics are clear; VoiceOver labels are correct.
Relay	Reachable-phone transfer creates the intended server record and returns the real status.
Offline	Capture survives Watch app exit/restart, later syncs exactly once and keeps truthful queued messaging.
Review	Ambiguous or high-impact actions show Needs review and hand off to the correct iPhone screen.
Privacy	Microphone indication, locked-screen privacy, deletion and audio retention match published disclosures.

17. £19.99 Pricing & Conversion Experience

Commercial decision: Rivetara is presented at £19.99 per month. The message should feel like a confident, fair exchange for admin time returned - never a loud interruption or pressure tactic.

Positioning and approved message

Primary customer-facing proposition:

> **Your admin, handled for £19.99 a month.**
> **Rivetara helps turn voice notes and job details into organised work, reminders, quotes and invoices - giving you more time for the jobs that pay.**

- Use £19.99/month consistently in customer-facing UK pricing. Do not alternate between £20 and £19.99 in the same journey.
- Lead with the outcome and time saved, then show the price. Avoid exaggerated guarantees, fake urgency, countdown timers, preselected consent or guilt-based copy.
- Where truthful and supported by product data, frame the price against trade time: "If Rivetara saves even half an hour, it can pay for the month." Do not claim a specific saving until measured or clearly presented as an example.
- Use plain wording. Rivetara is an AI office manager for the trade business, not a vague bundle of features.

When and where pricing appears

- Marketing page: show the core value and a short demonstration before the pricing card. Pricing remains easy to find but is not the first full-screen interruption.
- Onboarding: explain the trial and included capabilities after the user understands the one-button workflow. Do not demand payment before showing what Rivetara does unless the final commercial model requires it.
- In-product conversion: use a calm card after a genuine value moment, such as the first completed job capture, invoice draft or admin summary. Never interrupt active recording, urgent work or offline capture.
- Trial reminder: notify at sensible milestones and before renewal with the exact trial end, monthly price, renewal behaviour and cancellation route.
- Account settings: keep Plan & Billing permanently available with current plan, renewal date, payment source, Restore Purchases and Manage Subscription.

Pricing card content

- Headline: "Keep Rivetara working for you."
- Price line: "£19.99/month" with renewal interval given equal visual prominence.
- Value line: "One place for voice-led jobs, reminders, quotes, invoices and follow-ups."
- Primary action: "Start free trial" when a trial is genuinely available, otherwise "Continue with Rivetara" or the storefront-compliant purchase label.
- Secondary action: "Not now" or a close control when the user can continue. Do not conceal dismissal or repeatedly reopen the message during the same session.

- Required disclosure: trial duration, when charging begins, auto-renewal, cancellation method, what remains accessible after expiry, and links to terms and privacy policy.

Billing and Apple compliance

- The £19.99 price is a product decision, but final App Store tiers, tax display and storefront-localised prices must use StoreKit/App Store Connect values at runtime.
- Do not hard-code a web checkout link inside iOS or watchOS. Follow the live rules for the UK and each offered storefront at implementation and submission time.
- The Apple Watch companion does not contain a separate purchase flow. It reads the entitlement of the authenticated Rivetara account.
- Web, iPhone and Watch display the same canonical entitlement state after server-side reconciliation. Restore, grace-period, refund, cancellation and expiry behaviour must remain consistent.

Pricing acceptance tests

- A tester can find the price without hunting, but can also understand Rivetara before being asked to subscribe.
- No active task is interrupted by a pricing prompt. Dismissal works and frequency limits are enforced.
- £19.99/month, renewal, trial and cancellation information are readable with VoiceOver and Larger Text.
- StoreKit product data, checkout, receipt validation, entitlement and settings display agree across devices.
- Analytics measure view, dismissal, trial start and conversion without collecting unnecessary personal or job content.

18. UK Privacy, Login & In-App Rights

Launch rule: functional privacy buttons are necessary, but they do not prove legal compliance on their own. Public launch is blocked until controller details, suppliers, retention, contracts, assessments and response procedures are complete and independently reviewed.

Privacy information and accountability

- Show a layered UK privacy notice at or before collection. It must identify the controller and contact details; purposes and lawful bases; legitimate interests; categories; recipients; international transfers and safeguards; retention; rights; consent withdrawal; ICO complaint route; and any significant automated decision-making.
- Maintain a data inventory, processing record, lawful-basis register, retention schedule, supplier/sub-processor register, security controls register and evidence of every consent or withdrawal. Privacy by design and data minimisation apply to every feature.
- Complete a DPIA before high-risk AI, systematic monitoring, large-scale or sensitive processing. Complete legitimate-interest and international-transfer assessments where those bases or transfers are used.
- Use Article 28 processor contracts covering instructions, confidentiality, security, sub-processors, rights and breach assistance, deletion/return and audit information. Confirm UK transfer safeguards for any overseas processing.

Sign-up, login and session security

- Keep Terms acceptance separate from the privacy notice and from optional consent. No pre-ticked optional boxes. Record document version, timestamp, purpose, wording/source and withdrawal.
- Use server-side authentication before production: salted adaptive password hashing or platform identity, email verification, rate limiting, breached-password screening, secure reset, generic error messages, short-lived sessions, secure HttpOnly SameSite cookies, logout and session revocation.
- Require MFA for the owner/admin account and step-up authentication for exports, account deletion, payment changes and support actions. Admin access is server allowlisted, least-privilege and fully audited.
- Do not use analytics, device identifiers or non-essential storage before valid PECR consent. Strictly necessary login/security storage is documented and limited to that purpose.

In-app Privacy Centre

- Provide clear current status and one-tap allow/withdraw controls for optional AI processing, microphone use, diagnostics and marketing. Withdrawal must be as easy as granting permission and must stop future optional processing.
- Explain browser/OS microphone controls separately. Show a persistent recording indicator and never capture audio in the background without an active user request and platform permission.
- Provide access/export, correction, deletion, restriction and objection routes. Export uses a structured, commonly used format. Deletion covers production stores, processors and scheduled backup expiry, with lawful-retention exceptions explained.
- Create a verified rights-request case with received date, identity-check status, deadline, scope, decision, response and extension/exemption reason. Default response target is one month.
- The anonymous Support ID may locate an operational account but must not expose name, contact details, precise location, customer records or job content to the admin dashboard.

Retention, incidents and communications

- Approve category-specific retention for accounts, job/customer records, invoices/tax records, AI inputs/outputs, audio, diagnostics, support, audit/security logs and backups. Automate expiry and verify deletion.
- Maintain a breach register and tested incident plan. Assess incidents promptly; where UK GDPR requires, notify the ICO within 72 hours of awareness and notify affected people without undue delay when high risk exists.
- Direct marketing consent is separate, specific and recorded. Apply the PECR rules and any valid soft opt-in carefully, include an unsubscribe in every message and honour objections/suppression lists immediately.
- Check the ICO data-protection fee and registration position, appoint accountable privacy ownership, train support/admin users and schedule periodic access, supplier and DPIA reviews.

Required acceptance tests and launch gate

Area	Minimum acceptance
Choice	Optional controls default off; allow and withdraw both work; timestamped evidence updates.
Notice	All required UK information is complete, readable at collection and matches actual data flows.
Rights	Export, correction and deletion succeed end-to-end; verified requests are tracked to deadline.
Login	Real server authentication, secure reset/session revocation, rate limits and admin MFA pass testing.
Suppliers	Processor terms, sub-processors, locations, transfers, retention and deletion are approved.
Launch	DPIA/LIA/ROPA, incident plan, ICO fee check and UK legal review are signed off.

v1.4 authority: Sections 16-18 extend the v1.2 master specification. Section 17 controls the £19.99/month pricing decision. Section 18 controls UK privacy, login and rights requirements and creates a mandatory legal and security launch gate.
